Setting the Context

Security is said to be a critical concern for organizations in almost every industry due to its complexity and constant evolution. Both large or small organization are required to consume latest security resources than ever before, being one step ahead of the threats is very hard, but taking one step back can lead the organization to struggle with the protection of customers and financial information.

The situation requires constant attention and proper guidance of an executive-level leadership popularly known as CISO (Chief Information Security Officer).

But the challenge occurs where not many organizations can afford a fulltime executive-level CISO to oversee these functions, given the limited access to cybersecurity experts in the market today. Hence, requires a Virtual CISO to address the challenges which are faced by the organizations.

vCISO, is a professional who works routinely with organizations to provide all the essential cybersecurity support one would expect from an in-house senior executive within a more efficient and affordable service model.

CYBERSRC CONSULTANCY
